

Statement of Purpose (SOP)

AI Contract & Legal Document Analyzer

Legal documents play an important role in personal, business, and professional activities, but understanding them is often challenging for people without legal expertise. Contracts contain complex terminology, lengthy clauses, hidden risks, and important obligations that can easily be overlooked. Misunderstanding these documents may lead to financial losses, missed deadlines, or unfavorable agreements.

The purpose of this project is to develop an AI-powered Contract & Legal Document Analyzer that helps users understand legal documents in a simpler and more accessible way. The system will use Artificial Intelligence and Natural Language Processing techniques to analyze uploaded legal documents, identify important clauses, summarize complex legal content, and highlight potential risks and responsibilities.

The proposed system will allow users to upload legal documents such as agreements, contracts, and policies. The AI model will process the document, extract meaningful information, and provide a simplified explanation of the content. It will identify key sections such as payment terms, termination clauses, obligations, deadlines, and risk factors. Additionally, users will be able to interact with the system through a question-answer feature to get insights about the uploaded document.

The main objective of this project is to reduce the dependency on manual document review and make legal information more understandable for common users. By combining AI, Natural Language Processing, and document intelligence, this system aims to save time, improve decision-making, and help users identify important information before accepting legal agreements.

This project will be developed using modern technologies including a web-based frontend, backend services, database management, document processing tools, and Large Language Models for intelligent analysis. The system will focus on accuracy, usability, and providing clear explanations while maintaining user data security.

Through this project, we aim to bridge the gap between complex legal documentation and everyday users by creating an intelligent assistant that makes legal understanding faster, simpler, and more accessible.
